The most important customer journey—selecting products and requesting a quote—does not currently work clearly enough. This would stop customers from enquiring.

Continue curation
Change to Continue shopping

Request a quote asked me to fill out the enquiry form again
Should be able to see multiple pics of the same product
I am not given an add to basket option, just automatically assumes I want to enquire about a product when I click on it
I cannot scrolldown when the basket quote is open - I can only x out

What the quote journey should do

Each product card should have a clear button:

- Add to quote
- View details
- Quantity selector or quantity added later
- Confirmation such as “Added to your shortlist”

The quote basket should then show:

- Selected product images and names
- Estimated quantity for each item
- Event date or required delivery date
- Delivery postcode/country
- Packaging required
- Personalisation requirements
- Approximate budget per item or total budget
- Name, email and telephone number
- Free-text notes
- Clear response promise, for example: “We normally respond within one working day”

After submission, show a proper confirmation screen and send an automatic email containing the selected items.

At present, several buttons appear to send users to the wrong destination or simply back to the homepage. Fix:

- Request a quote
- Select gift
- Build a gift set
- Choose products
- Every product image/card
- Footer quote link
- Basket icon/count

Every page should have a prominent and functioning Request a quote button.

Add proper product detail pages
Currently, visitors mostly see a product name, material/category
Each product needs:

- Multiple clear photographs
- Dimensions
- Weight or capacity
- Exact material

Reduce repetition and page length
The homepage lists a very large number of products, followed by artisan information, packaging, collections, testimonials and FAQs.
This creates too much scrolling. I would show:

- 6–9 of the best products products
- One packaging section
- One genuine case study
- A strong final quote call-to-action

Then use the gallery as the complete catalogue.\
The wedding and corporate pages also contain lengthy explanatory sections followed by long product grids. They could be cut by around 25–35% without losing anything important.

Improve product browsing
The homepage has filters for material and category, but the gallery appears to present the entire collection without an equivalent visible filtering structure.
Add filters for example:

- Material
- Product type
- Minimum order quantity
- Personalisation available
- Suitable for travel/destination weddings
- Under a certain size or weight

Also add a search bar.
